

During Hackathon

When using event listeners

```
function addIngredient(event) {  
  event.preventDefault();
```

Learning from Chris' recap at end of Hackathon

`App.use(express.static("public"));` *Only allows the public to view the "public" folder (not anything else)*

`App.use` is triggered for all HTTP Methods (GET, POST, PUT, PATCH AND DELETE)

`"/recipes/:blahblah"` *: is a placeholder – whatever is written after the last slash is stored in a variable called blahblah (which is stored inside req.params object so selected with req.params.blahblah)*
