Group learning from Week 11 Day 2

Network tab in dev tools will show you what requests are being made (when people were encountering the "//" problem with the URL). Don't rely on the code as when using routes and models, it may pass the wrong path that way, but look like a single "/" in the code.

Force redeploy when changing environment variables on Netlify as it doesn't reload them automatically (Heroku does this for you).

Have a strategy for debugging (e.g. console.log() in certain places).

Continue to get things working locally first, as this will give you confidence it is working.
